

molbox1 Flow Terminal, Using DMM connector on back panel

molbox1 or molbox1+ rear panel

The DMM connector has 8 or 3 pins depending on the age of the molbox1 flow terminal. Only 2 of the pins are connected. This connection can be used to measure the voltage signal coming back from a MFC or MFM with an external DMM (that perhaps has better accuracy than the molbox1 internal MFC option circuit). The DMM connector is very rarely used.
